# Chapter 1

## Trust through Stories

This book contains stories about where certain public keys came from and a little about the people who use them.

Some people use public key cryptography to digitally sign their works. They do this so others can prove where copies of such works came from. Usually, digital tools automatically verify these digital signatures so people don't have to manually. However, in order to verify such tools, at some point a person must verify at least one digital signature for themselves.

## **Chapter 2**

### **List of Public Keys**

Each section in this chapter contains a story about a person or organization that uses a public-private key pair. Each story consists of some brief background information, a history of notable events, and public key information. Key fingerprints are included. Links to public keys are made available where possible.

## 2.1 BITCOIN CORE

### 2.1.1 Background

BITCOIN CORE<sup>2.1.1</sup> is the “reference implementation” of the BITCOIN protocol. It is maintained by a group of people who have become known as the BITCOIN CORE developers.

Early in the blockchain's history, the software that verified transactions against balances of previous transactions was a WINDOWS executable known as BITCOIN. The initial release of this software was by an entity that called themselves SATOSHI NAKAMOTO. Satoshi later gave up the code maintainer role of the project. The person who subsequently gained control was a person named GAVIN ANDRESEN. The software was rebranded from BITCOIN to BITCOIN CORE at version 0.9.0.<sup>2.1.2</sup> A developer named WLADIMIR J. VAN DER LAAN became owner of the signing keys of the reference implementation starting at version 0.9.3. VAN DER LAAN originally used a personal key (7481 0B01 2346 C9A6) to sign binaries but later created a dedicated key (90C8 019E 36C2 E964) to sign binaries.

There exist various dubious theories regarding PGP key use by SATOSHI NAKAMOTO.<sup>2.1.3</sup> The most likely candidate (18C0 9E86 5EC9 48A1) is one signed by BITCOIN CORE developers PETER TODD (7FAB 1142 67E4 FA04) and WLADIMIR J. VAN DER LAAN (7481 0B01 2346 C9A6).

### 2.1.2 History

**2011-08-24.** Creation date of VAN DER LAAN's personal signing key 7481 0B01 2346 C9A6.

**2011-12-15.** Creation date of Andresen's dedicated code signing key 29D9 EE6B 1FC7 30C1.

**2013-03-23.** Earliest snapshot of the <https://bitcoin.org> website on the INTERNET ARCHIVE.<sup>2.1.4</sup> It is a redirect to <https://bitcoin.org/en>.

**2013-04-11.** Earliest snapshot of the <https://bitcoincore.org> website on the INTERNET ARCHIVE.<sup>2.1.5</sup>

**2013-07-27.** Earliest snapshot of main GITHUB repository at <https://github.com/bitcoin/bitcoin> on the INTERNET ARCHIVE.<sup>2.1.6</sup>

**2014-03-19.** The reference client rebranded from BITCOIN to BITCOIN CORE.

**2014-04-08.** Gavin Andresen steps down as lead developer. Hands over role to WLADIMIR J. VAN DER LAAN.<sup>2.1.7</sup> Andresen maintains commit privileges to the GITHUB repository.

**2015-06-24.** Creation date of VAN DER LAAN's dedicated code signing key 90C8 019E 36C2 E964.

**2016-05-02.** Gavin Andresen's commit privileges were revoked by other BITCOIN CORE developers after Andresen published a blog post claiming Craig Wright was Satoshi Nakamoto.<sup>2.1.8</sup>

### 2.1.3 Public Key Details

#### 2.1.3.1 Binary Signing Key (v0.11.0–) (90C8 019E 36C2 E964)

This key<sup>2.1.9</sup>, owned by WLADIMIR J. VAN DER LAAN, has been used to sign BITCOIN CORE releases since version 0.11.0.

```
pub  rsa4096/0x90C8019E36C2E964 2015-06-24 [SC] [expires: 2022-02-10]

### 2.1.3.2 Binary Signing Key (v0.9.3–v0.10.2) (7481 0B01 2346 C9A6)

WLADIMIR VAN DER LAAN used his personal key<sup>2.1.10</sup> to sign BITCOIN versions v0.9.3–v0.10.2.

```
pub  rsa2048/0x74810B012346C9A6 2011-08-24 [SC] [expires: 2022-02-10]

### 2.1.3.4 SATOSHI NAKAMOTO (18C0 9E86 5EC9 48A1)

The dsa1024 algorithm this key<sup>2.1.12</sup> uses is considered weak by the the NIST standard SP800-57 Part 1 Revision 5: *Recommendation for Key management*.<sup>2.1.13</sup> The key offers only 80 bits of security against the possibility of impersonation via a brute force attack. Nevertheless, this key has a signature of BITCOIN CORE developer PETER TODD (7FAB 1142 67E4 FA04) dated 2013-10-12. Todd also committed the full fingerprint in a BITCOIN FOUNDATION document on 2013-04-26<sup>2.1.14</sup>. This key also has a signature of BITCOIN CORE maintainer VLADIMIR J. VAN DER LAAN's personal key (7481 0B01 2346 C9A6) dated 2013-05-10, albeit revoked on 2016-05-02.

2.1.13. See <https://doi.org/10.6028/NIST.SP.800-57pt1r5>, table 2, page 54. dsa1024 keys have only offer 80 bits of security against brute force attacks.

2.1.14. See <https://github.com/pnlaw/The-Bitcoin-Foundation-Legal-Repo/commit/fb70771a9927e04e5e33c46ba6589a9703e40>.

## 2.2 CRYPTOMATOR

### 2.2.1 Background

CRYPTOMATOR<sup>2.2.1</sup> is a cross-platform file storage privacy application. It permits storing files on a third-party file storage services (e.g. DROPBOX) in encrypted form and accessible to the user as a virtual mountable drive. In other words, CRYPTOMATOR acts as an encryption layer between a user and a file storage service. Compiled binary releases are available for WINDOWS, MACOS, LINUX, ANDROID, and IOS<sup>2.2.2</sup>.

As of 2021-12-22, the latest version of CRYPTOMATOR is version *1.6.5 (Hotfix)* available on GITHUB<sup>2.2.3</sup>. Judging from commit signatures of the GITHUB repository<sup>2.2.4</sup>, the main developers appear to be SEBASTIAN STENZEL (667B 866E A824 0A09) ARMIN SCHRENK (748E 55D5 1F5B 3FBC), and TOBIAS HAGEMANN (69CE FAD5 1959 8989).

### 2.2.2 History

- 2015-01-01. First snapshot of <https://cryptomator.org> captured on the INTERNET ARCHIVE<sup>2.2.5</sup>. Signature of latest version of CRYPTOMATOR (1.4.11) uses PGP key 509C 9D63 34C8 0F11<sup>2.2.6</sup>
- 2018-06-17. Binary signing PGP key 509C 9D63 34C8 0F11 published as GITHUB gist<sup>2.2.7</sup>. Key used to sign CRYPTOMATOR versions prior to 1.5.8.
- 2020-09-01. Binary signing PGP key 615D 449F E6E6 A235 published as GITHUB gist<sup>2.2.8</sup>. Key used to sign CRYPTOMATOR version 1.5.8 onward (as of 2021-12-22).
- 2020-09-02. Old binary signing PGP key 615D 449F E6E6 A235 signed by new PGP key 509C 9D63 34C8 0F11<sup>2.2.9</sup>. Notice of revocation of old key and signing of new key by old key posted in GITHUB issue thread<sup>2.2.10</sup>.

### 2.2.3 Public Key Details

#### 2.2.3.1 Binary signing key (-v1.5.7) (509C 9D63 34C8 0F11)

PGP key used to sign compiled binary releases of CRYPTOMATOR prior to version 1.5.8.

```
pub  rsa4096/0x509C9D6334C80F11 2016-06-24 [SC] [expires: 2021-12-31]

## 2.3 DEBIAN

### 2.3.1 Background

DEBIAN<sup>2.3.1</sup> is a free operating system from which many GNU/LINUX systems are derived. Such derived systems include UBUNTU, TAILS, KALI LINUX, and others.

DEBIAN is maintained by an association of developers who use GnuPG keys to sign announcements of software they contribute in order to protect against forgeries. A git repository containing GnuPG keyrings of DEBIAN keys is available at <https://salsa.debian.org/debian-keyring/keyring> or by installation of the `debian-keyring` package<sup>2.3.2</sup> within a DEBIAN system.

The DEBIAN PROJECT was founded in 1993 by IAN ASHLEY MURDOCK. Various individuals have led the project since.<sup>2.3.3</sup> As of 2021-09-25, the latest release of the operating system is called “DEBIAN 11 (BULLSEYE)”.

### 2.3.2 History

**1993-08-16.** The DEBIAN PROJECT officially founded by IAN ASHLEY MURDOCK.

**1999-01-30.** Creation date of the Debian CD signing key `7C3B 7970 88C7 C1F7`.

**2000-09-16.** Creation date of SANTIAGO GARCIA MANTINAN's key `72FD C205 F6A3 2A8E`.

**2004-06-20.** Creation date of DANIEL BAUMANN's key `F82E 5CC0 4B2B 2B9E`.

**2009-10-03.** Creation date of the Debian CD signing key `9880 21A9 64E6 EA7D`.

**2011-01-05.** Creation date of the Debian CD signing key `DA87 E80D 6294 BE9B`.

**2014-04-15.** Creation date of the Debian Testing CDs Automatic Signing Key `4246 8F40 09EA 8AC3`.

### 2.3.3 Public Key Details

#### 2.3.3.1 Installation Image Signature Keys

The DEBIAN website makes available images of the operating system that can be installed onto and executed from removable media such as Compact Discs (CD), Digital Versatile Disc (DVD), and Universal Serial Bus (USB) storage devices. A set of GnuPG public key fingerprints have been listed on the `debian.org` website at <https://debian.org/CD/verify>. Table 2.3.1 summarizes the creation dates, long IDs, and availabilities of these keys. Full fingerprints and other information may be found in section 2.3.3.2.

### 2.3.3.2 Verbose key details

#### Key 1999-01-30 (7C3B 7970 88C7 C1F7)

A 1024-bit DSA key that is the earliest dated key for signing Debian CDs mentioned at <https://debian.org/CD/verify> according to the INTERNET ARCHIVE<sup>2.3.11</sup>. Mention of this key was removed from that page by the end of 2015. A copy of this key can be found at the personal website of STEVE MCINTYRE, a debian developer.<sup>2.3.12</sup>

```
pub dsa1024/0x7C3B797088C7C1F7 1999-01-30 [SCA] [revoked: 2017-01-11]
Key fingerprint = AC65 6D79 E362 32CF 77BB BOE8 7C3B 7970 88C7 C1F7
uid [ revoked] Steve McIntyre <steve@einval.com>
uid [ revoked] Steve McIntyre <stevem@chiark.greenend.org.uk>
uid [ revoked] Steve McIntyre <93sam@debian.org>
uid [ revoked] Debian CD signing key <debian-cd@lists.debian.org>
```

#### Key 2000-09-16 (72FD C205 F6A3 2A8E)

A 1024-bit DSA key listed as being a signing key for Debian CD images as of 2011 at <https://debian.org/CD/verify> according to the INTERNET ARCHIVE. Mention of this key was removed from that page by the end of 2015. A copy of this key was archived from the [pgp.mit.edu](https://pgp.mit.edu) keyserver.<sup>2.3.13</sup> This 1024-bit DSA key was deprecated in favor of a 4096-bit RSA key with fingerprint B868 8CA3 D876 D5A3 in a signed blog post at [blog.manty.net](https://blog.manty.net).<sup>2.3.14</sup>

```

## 2.4 GITHUB

### 2.4.1 Background

GITHUB<sup>2.4.1</sup> is a commercial GIT repository hosting service company founded in 2008. It was purchased by MICROSOFT in 2016.[1]

### 2.4.2 History

**2008.** GITHUB founded in San Francisco.[1]

**2008-03-10.** GITHUB parent company LOGICAL AWESOME, LLC registered in San Francisco by Chris Wanstrath.<sup>2.4.2</sup>

**2008-05-14.** First snapshot of the <https://github.com> website on the INTERNET ARCHIVE.<sup>2.4.3</sup>

**2017-08-16.** Creation date of the `4AEE 18F8 3AFD EB23` public key according to itself.

**2017-11-14.** Date of INTERNET ARCHIVE snapshot containing an early link to <https://github.com/web-flow.gpg> from a page on the [help.github.com](https://help.github.com) domain.<sup>2.4.4</sup> Also the date of a post by GITHUB user jonathancross<sup>2.4.5</sup> observing that the `4AEE 18F8 3AFD EB23` key appears to be a new feature<sup>2.4.6</sup>:

Yeah, just experimented and saw the same thing. Strange new “feature” of GitHub it seems.

**2018-06-04.** First snapshot of the `4AEE 18F8 3AFD EB23` public key <https://github.com/web-flow.gpg> on the INTERNET ARCHIVE.<sup>2.4.7</sup>

**2021-05-25.** Public key `4AEE 18F8 3AFD EB23` fingerprint explicitly published at GITHUB documentation website.<sup>2.4.8</sup>

### 2.4.3 Public Key Details

#### 2.4.3.1 Web-flow commit signing (`4AEE 18F8 3AFD EB23`)

As of 2021-07-19, when a user logs into [github.com](https://github.com) and creates a GIT commit through a web browser, GITHUB will automatically sign the commit against a GPG key<sup>2.4.9</sup> with the fingerprint:

```
pub    rsa2048/0x4AEE18F83AFDEB23 2017-08-16 [SC]
       Key fingerprint = 5DE3 E050 9C47 EA3C F04A 42D3 4AEE 18F8 3AFD EB23
uid    [ unknown] GitHub (web-flow commit signing) <noreply@github.com>
```

This key is available for download at GITHUB's documentation website at <https://github.com/web-flow.gpg>.<sup>2.4.10</sup> This particular link as well as the full key fingerprint was added to the GITHUB documentation repository in a commit dated 2021-05-25<sup>2.4.11</sup>.

2.4.1. Main website: <https://github.com/>.

2.4.2. See <https://businesssearch.sos.ca.gov/Document/RetrievePDF?Id=200807010145-721605> and <https://businesssearch.sos.ca.gov/Document/RetrievePDF?Id=200807010145-2544282> from [https://opencorporates.com/companies/us\\_ca/200807010145](https://opencorporates.com/companies/us_ca/200807010145).

## 2.5 RASPIBLITZ

### 2.5.1 Background

RASPIBLITZ<sup>2.5.1</sup> is a software package designed to facilitate operation of a LIGHTNING NETWORK and BITCOIN node. The software is version controlled using GIT, with the main git repository available at GITHUB<sup>2.5.2</sup>. As of 2021-07-18, the principal maintainer appears to be CHRISTIAN “ROOTZOL” ROTZOLL<sup>2.5.3</sup>.

### 2.5.2 History

**2019-09-03.** The creation date of rootzol's 1C73 060C 7C17 6461 public key.

**2019-09-05.** ROOTZOL added their public key fingerprint 1C73 060C 7C17 6461 to the FAQ of the RASPIBLITZ GITHUB repository<sup>2.5.4</sup>. They linked their [keybase.io](https://keybase.io) page as a source of the public key.

**2020-10-31.** The first snapshot of the [raspi blitz.org](https://raspi blitz.org) website appeared on the Internet Archive<sup>2.5.5</sup>.

**2021-02-07.** Andreas Antonopoulos posted a YouTube video identifying RASPIBLITZ as a popular Bitcoin full node software package<sup>2.5.6</sup>.

**2021-05-18.** ROOTZOL added their public key fingerprint 1C73 060C 7C17 6461 to the README of the RASPIBLITZ GITHUB repository.

### 2.5.3 Public Key Details

#### 2.5.3.1 CHRISTIAN “ROOTZOL” ROTZOLL (1C73 060C 7C17 6461)

ROOTZOL's PGP key<sup>2.5.7</sup> may be downloaded from their Keybase page<sup>2.5.8</sup>. Their fingerprint information is as follows:

```
pub  rsa4096/0x1C73060C7C176461 2019-09-03 [C]
    Key fingerprint = 92A7 46AE 33A3 C186 D014 BF5C 1C73 060C 7C17 6461
uid  [ unknown] Christian Rotzoll <christian@rotzoll.de>
sub  rsa4096/0xAA9DD1B5CC5647DA 2019-09-03 [S] [expires: 2021-10-21]

## 2.6 SATOSHI LABS

### 2.6.1 Background

SATOSHI LABS<sup>2.6.1</sup> is a company that produces cryptocurrency hardware wallets called TREZOR<sup>2.6.2</sup>. These devices enable a user to privately manage their private keys necessary to create transactions. Publishing transactions and viewing current balances typically requires software running on a computer connected to the internet. SATOSHI LABS uses an OpenPGP key to sign these software packages published on their website <https://trezor.io>.

SATOSHI LABS was founded in 2013 by MAREK “SLUSH” PALATINUS, PAVOL “STICK” RUSNÁK, and ALENA VRANOVA.<sup>2.6.3</sup> It is based in Prague, Czech Republic.

As of 2022-01-03, the primary TREZOR program requiring verification is TREZOR SUITE.

### 2.6.2 History

**2012-03-07.** Creation date of PAVOL RUSNÁK’s personal PGP key (91F3 B339 B9A0 2A3D).

**2014-07-18.** First snapshot of <https://mytrezor.com> appears on the INTERNET ARCHIVE.<sup>2.6.4</sup>

**2017-01-11.** [mytrezor.com](https://mytrezor.com), [buytrezor.com](https://buytrezor.com), and other domains migrated to <https://trezor.io>.<sup>2.6.5</sup>

**2017-01-28.** The first snapshot of <https://trezor.io> appears on the INTERNET ARCHIVE.<sup>2.6.6</sup>

### 2.6.3 Public Key Details

#### 2.6.3.1 PAVOL RUSNÁK (91F3 B339 B9A0 2A3D)

A key<sup>2.6.9</sup> used by a developer named PAVOL “STICK” RUSNÁK.<sup>2.6.10</sup> This key has been used to sign TREZOR software in the past<sup>2.6.11</sup> such as TREZOR BRIDGE<sup>2.6.12</sup> and other various GITHUB commits.

```
pub  rsa4096/0x91F3B339B9A02A3D 2012-03-07 [SC] [expires: 2022-01-16]

## 2.7 YOUTUBE-DL

### 2.7.1 Background

YOUTUBE-DL<sup>2.7.1</sup> is a PYTHON2-based<sup>2.7.2</sup> program that can be used to download audio-visual media files from sites including, but not limited to, YOUTUBE. The software gained notoreity in 2020 when GITHUB took down the project page upon receiving a DMCA takedown notice issued by the RIAA.<sup>2.7.3</sup>

As of 2021, the project maintainer was SERGEY M. (0x2C393E0F18A9236D).

Since 2021-12-25, the core developer is REMITA AMINE<sup>2.7.4</sup> (?).

### 2.7.2 History

**2008-07-21.** First commit in the main project GIT repository published by RICARDO GARCIA.<sup>2.7.5</sup>

**2013-08-01.** First image of the homepage <https://yt-dl.org> appears on the INTERNET ARCHIVE.

**2020-10-23.** GITHUB project page taken down due to DCMA takedown notice<sup>2.7.6</sup> issued by the RIAA.<sup>2.7.7</sup>

**2020-11-16.** GITHUB page for YOUTUBE-DL reinstated.<sup>2.7.8</sup>

**2021-12-25.** The only active developer is REMITA AMINE (?).<sup>2.7.9</sup>

**2022-01-29.** The project announced<sup>2.7.10</sup> that it is seeking a new maintainer, that YOUTUBE-DL would continue to support PYTHON2, and that the fork YT-DLP created by PUKKANDAN (0x7EEEE9E1E817D0A39) would support PYTHON3.

### 2.7.3 Public Key Details

#### 2.7.3.1 Binary signing key. SERGEY M. (0x2C393E0F18A9236D)

The binary signing key used to sign releases as of 2021.

```
pub  rsa4096/0x2C393E0F18A9236D 2016-04-09 [SC]
     Key fingerprint = ED7F 5BF4 6B3B BED8 1C87 368E 2C39 3E0F 18A9 236D

```

## **Appendix A**

# **How Public Key Cryptography Works**

This appendix describes in more detail how public key cryptography works.

# Appendix B

## How to use GPG

This appendix describes in more detail how to use GPG. Examples assume use of GPG version 2.2.12.

### B.1 Definitions

**Long ID.** A 16-digit hexadecimal number used to identify a public key, e.g. `A0A2 95AB DC34 69C9`. Its hexadecimal nature may be emphasized by prepending the string with the “0x” prefix and omitting spaces, e.g. `0xA0A295ABDC3469C9`.<sup>B.1.1</sup> GPG is not particular about whether letters in the Long ID are upper or lowercase, so `0xa0a295abdc3469c9` is also acceptable.

**Short ID.** An 8-digit hexadecimal number similar to a Long ID. Use of Short IDs is not recommended because, as of 2021, generating multiple public keys with matching Short IDs requires a negligible amount of computing power.<sup>B.1.2</sup>

**Remark B.1.1.** Example code is sometimes given in the form of a BASH script. Such scripts usually have a first line like `#!/usr/bin/env bash` that tell your interpreter to execute the lines that follow as BASH commands. This is useful from a typography standpoint because often the length of GPG commands can exceed the recommended character limit for human readability.<sup>B.1.3</sup> This document will attempt to limit line widths in code examples to approximately 80 characters.

### B.2 Useful Commands

#### B.2.1 Obtaining keys

##### B.2.1.1 Import a public key

The `$ gpg --import key.asc` command may be used to import a file named “key.asc”. If the `$ gpg --import` command by itself is run and a clipboard program is available (e.g. copy/paste), then pasting the text of a public key into the shell followed by pressing `ctrl-d` (i.e. providing an “end of transmission” character<sup>B.2.1</sup>) will tell `gpg` to process the pasted text.

##### B.2.1.2 Download from a keyserver

The `$ gpg --receive-keys` command can be used as shown in the example below to download a public key (e.g. `4246 8F40 09EA 8AC3`) from a keyserver (e.g. `keyserver.ubuntu.com`).

```
$ gpg --receive-keys --keyserver keyserver.ubuntu.com 42468f4009ea8ac3
gpg: key 0x42468F4009EA8AC3: public key "Debian ... <debian-cd@lists.debian.org>" imported
gpg: Total number processed: 1
gpg:                imported: 1
```

B.1.1. See <https://stackoverflow.com/questions/2670639/why-are-hexadecimal-numbers-prefixed-with-0x>.

B.1.2. See <https://security.stackexchange.com/questions/84280/>.

B.1.3. EMACS, for example, defaults to wrapping columns of text to 70. See <https://emacs.stackexchange.com/questions/36118/>.

B.2.1. See <https://unix.stackexchange.com/a/110248>.

As of 2022-01-14, few keyserver provide full public keys due to an unsolved certificate spam problem.<sup>B.2.2</sup>

- [keyserver.ubuntu.com](https://keyserver.ubuntu.com) - Provides full keys.
- [keyring.debian.org](https://keyring.debian.org) - Provides full keys of DEBIAN developer and maintainers.
- [keys.openpgp.org](https://keys.openpgp.org) - Provides keys without user IDs unless key owner authenticates themselves via the user ID email address.

## B.2.2 Analyzing keys

### B.2.2.1 View public key fingerprint

- Show fingerprints of the primary key and subkeys . The example below shows the primary fingerprint in **red**, the Long ID colored in **brown**, user IDs in **blue**, and fingerprints of subkeys **dark green**.

```
$ gpg --fingerprint 0xa0a295abdc3469c9
pub  rsa4096/0xA0A295ABDC3469C9 2017-10-11 [C] [expires: 2022-07-08]
    Key fingerprint = 3457 A265 922A 1F38 39DB 0264 A0A2 95AB DC34 69C9
uid          [ultimate] Steven Sandoval <baltakatei@gmail.com>
uid          [ultimate] Steven Sandoval <baltakatei@alumni.stanford.edu>
sub  rsa4096/0x6DD7D496916A1253 2018-05-16 [E] [expires: 2022-07-07]
    Key fingerprint = 5E55 5FC6 1C85 871E 813B 5BCF 6DD7 D496 916A 1253
sub  rsa4096/0x57DA57D9517E6F86 2018-05-16 [S] [expires: 2022-07-07]
    Key fingerprint = 38F9 6437 C83A C88E 28B7 A952 57DA 57D9 517E 6F86
sub  rsa4096/0x5F9D26B9A598A2D3 2018-05-16 [A] [expires: 2022-07-07]
    Key fingerprint = EDCA 7EE7 D09E 7F2E 1DF6 A229 5F9D 26B9 A598 A2D3
```

## B.2.3 Sending keys

### B.2.3.1 Export public key

- Export public key according to last 16 characters of public key fingerprint (i.e. “long ID”, e.g. **A0A2 95AB DC34 69C9**).

```
$ gpg --export --output /tmp/key 0xa0a295abdc3469c9.
```

- Export the smallest key possible. Useful to strip key of signatures except for self-signatures. This creates an ASCII-armored<sup>B.2.3</sup> text file named **pubkey.asc** in the **/tmp** directory.

```
#!/usr/bin/env bash
gpg --export --export-options export-minimal \
  --armor \
  --output /tmp/pubkey.asc \
  0xa0a295abdc3469c9
```

## B.2.4 Creating keys

### B.2.4.1 Using default settings

Running `$ gpg --gen-key` will guide the user to creating a key with default settings.

### B.2.4.2 With subkeys

The `$ gpg --expert --full-gen-key` command in combination with some modifications to the configuration file `~/.gnupg/gpg.conf` may be used to create an OpenPGP key with subkeys. Subkeys are useful since their private components can be loaded onto a smartcard while keeping the primary key offline, available to create new subkeys. This may be desirable if a primary key is intended to be used over a long time period and the risk of losing an online defaultly configured key is unacceptable. Please see the article by Thierry Thuron titled “OpenPGP - The Almost Perfect Key Pair” for a useful procedure.<sup>B.2.4</sup>
